2028_REC_OOPS using Java_Week 8_Q1

Attempt : 1
Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotExceptionAtTheRateExceptionDomainException

A typical email address should have a " . " character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

Input Format

The first line of input contains the email to be validated.

Output Format

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

Sample Test Case

Input: sample@gmail.com
Output: Valid email address

Answer

```java
// You are using Java
import java.util.Scanner;

class DotException extends Exception {
  public DotException(String message) {
      super(message);
  }
}

class AtTheRateException extends Exception {
  public AtTheRateException(String message) {
      super(message);
  }
}

class DomainException extends Exception {
  public DomainException(String message) {
      super(message);
  }
}

class EmailValidator {

  public static void validateEmail(String email) throws DotException,
AtTheRateException, DomainException {
      int atCount = 0;
      for (char c : email.toCharArray()) {
        if (c == '@') atCount++;
      }
      if (atCount != 1) {
          throw new AtTheRateException("Invalid @ usage");
      }
```

```java
        if (email.startsWith(".") || email.startsWith("@") || email.endsWith(".") ||
email.endsWith("@")) {
            throw new DotException("Invalid Dot usage");
        }

        if (email.contains("..")) {
            throw new DotException("Invalid Dot usage");
        }

        String[] parts = email.split("@");
        String domainPart = parts[1];

        if (!domainPart.contains(".")) {
            throw new DotException("Invalid Dot usage");
        }

        String domainExtension = domainPart.substring(domainPart.lastIndexOf('.')
+ 1);
        if (!domainExtension.equals("in") && !domainExtension.equals("com") &&
            !domainExtension.equals("net") && !domainExtension.equals("biz")) {
            throw new DomainException("Invalid Domain");
        }

        System.out.println("Valid email address");
    }
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String email = sc.nextLine().trim();

        try {
            validateEmail(email);
        } catch (DotException de) {
            System.out.println("DotException: " + de.getMessage());
            System.out.println("Invalid email address");
        } catch (AtTheRateException ae) {
            System.out.println("AtTheRateException: " + ae.getMessage());
            System.out.println("Invalid email address");
        } catch (DomainException de) {
            System.out.println("DomainException: " + de.getMessage());
            System.out.println("Invalid email address");
```

```
        }

        sc.close();
    }
}
```

Status : Correct   **Marks : 10/10**
